

1 SECURITY SYSTEMS AND METHODS

2  
3 ABSTRACT

4  
5 A security system is disclosed, which includes a  
6 transmitter for transmitting a data stream, and a camera  
7 module, coupled to the transmission means, for taking  
8 imagery of a location and converting the imagery to data  
9 for inclusion in the data stream. Apparatus, coupled to  
10 the transmission means and the camera module, is adapted to  
11 detect a security breach at the location, activate the  
12 camera module and activate the transmission means to  
13 transmit a data stream including the data from the camera  
14 module. The imagery taken by the camera module consists of  
15 at least one of audio/video imagery and video imagery.
